

ABSTRACT OF THE DISCLOSURE

A case of tilt angle measuring apparatus is composed of a case body for housing ultrasonic sensors and a cover for covering a top of the case body, and the case body includes a
5 bottom plate having windows for exposing the ultrasonic wave transmitting/receiving faces of the ultrasonic sensors, a side plate extending upward from the peripheral edge of the bottom plate and abutting against the bottom surface of the cover, and
10 horn parts extending downward from the bottom plate so as to surrounding the windows.
